$$\Xi$$
(1820) 3/2 $^-$

$$I(J^P) = \frac{1}{2}(\frac{3}{2})$$
 Status: ***

The clearest evidence is an 8-standard-deviation peak in ΛK^- seen by GAY 76C. TEODORO 78 favors J=3/2, but cannot make a parity discrimination. BIAGI 87C is consistent with J=3/2 and favors negative parity for this J value.

≡(1820) MASS

We only average the measurements that appear to us to be most significant and best determined.

Ξ (1820) FOOTNOTES

 $^{^1}$ BIAGI 87 also sees weak signals in the in the $\Xi^-\pi^+\pi^-$ channel at 1782.6 \pm 1.4 MeV ($\Gamma=6.0\pm1.5$ MeV) and 1831.9 \pm 2.8 MeV ($\Gamma=9.6\pm9.9$ MeV).

 $^{^2}$ BADIER 72 adds all channels and divides the peak into lower and higher mass regions. The data can also be fitted with a single Breit-Wigner of mass 1800 MeV and width 150 MeV.

From a fit to inclusive $\Xi\pi$, $\Xi\pi\pi$, and ΛK^- spectra.

⁴ From a fit to inclusive $\Xi \pi$ and $\Xi \pi \pi$ spectra only.

⁵ Including $\Xi \pi \pi$.

⁶ DAUBER 69 uses in part the same data as SMITH 65C.

⁷ For the decay mode $\Xi^-\pi^+\pi^0$ only. This limit includes $\Xi(1530)\pi$.

⁸ Or less. Upper limit for the 3-body decay.
