

$$I(J^P) = \frac{1}{2}(0^-)$$

# $m_{K_L^0} - m_{K_S^0}$

For earlier measurements, beginning with GOOD 61 and FITCH 61, see our 1986 edition, Physics Letters **170B** 132 (1986).

OUR FIT is described in the note on "CP violation in  $K_L$  decays" in the  $K_L^0$  Particle Listings. The result labeled "OUR FIT Assuming CPT" ["OUR FIT Not assuming CPT"] includes all measurements except those with the comment "Not assuming CPT" ["Assuming CPT"]. Measurements with neither comment do not assume CPT and enter both fits.

 $<sup>^1</sup>$  The two ABOUZAID 11 values use the same data. The first enters the "assuming  $\mathit{CPT}$ " fit and the second enters the "not assuming  $\mathit{CPT}$ " fit.

<sup>&</sup>lt;sup>2</sup> ABOUZAID 11 fit has  $\Delta m$ ,  $\tau_{\mathcal{S}}$ ,  $\phi_{\epsilon}$ ,  $\mathrm{Re}(\epsilon'/\epsilon)$ , and  $\mathrm{Im}(\epsilon'/\epsilon)$  as free parameters. See  $\mathrm{Im}(\epsilon'/\epsilon)$  in the " $K_L^0$  CP violation" section for correlation information.

 $<sup>^3</sup>$  ABOUZAID 11 fit has  $\Delta m$  and  $\tau_{\rm S}$  free but constrains  $\phi_{\epsilon}$  to the Superweak value, i.e. assumes CPT. See " $K^0_{\rm S}$  Mean Life" section for correlation information.

 $<sup>^4</sup>$  Fits  $\Delta m$  and  $\phi_{+-}$  simultaneously. GIBBONS 93C systematic error is from B. Winstein via private communication. 20–160 GeV K beams.

 $<sup>^5</sup>$  GIBBONS 93 value assume  $\phi_{+-}=\phi_{00}=\phi_{\rm SW}=(43.7\pm0.2)^\circ$  , i.e. assumes *CPT*. 20–160 GeV *K* beams.

<sup>&</sup>lt;sup>6</sup> These two experiments have a common systematic error due to the uncertainty in the momentum scale, as pointed out in WAHL 89.

- $^7$  GJESDAL 74 uses charge asymmetry in  $K^0_{\ell 3}$  decays.
- $^8$  ALAVI-HARATI 03 fit  $\Delta m$  and  $au_{{\cal K}^0_{f c}}$  simultaneously.  $\phi_{+-}$  is constrained to the Superweak value, i.e.  $\mathit{CPT}$  is assumed. See " $\mathit{K}^0_S$  Mean Life" section for correlation information. Superseded by ABOUZAID 11.
- $^{9}$  ALAVI-HARATI 03 fit  $\Delta \emph{m},~\phi_{+-}$ , and  $au_{\emph{K}_{S}}$  simultaneously. See  $\phi_{+-}$  in the " $\emph{K}_{L}$  CP violation" section for correlation information. Superseded by ABOUZAID 11.
- $^{10}$  ANGELOPOULOS 01 uses strong interactions strangeness tagging at two different times.
- $^{11}$  Uses  $\overline{K}^0_{e3}$  and  $K^0_{e3}$  strangeness tagging at production and decay. Assumes *CPT* conservation on  $\Delta S = -\Delta Q$  transitions.
- $^{12}$  ADLER 96C is the result of a fit which includes nearly the same data as entered into the "OUR FIT" value above.
- $^{13}$  ARONSON 82 find that  $\Delta m$  may depend on the kaon energy.
- $^{14}$  ARONSON 70 and CARNEGIE 71 use  $K_S^0$  mean life  $= (0.862 \pm 0.006) imes 10^{-10}$  s. We have not attempted to adjust these values for the subsequent change in the  $K^0_S$  mean life or in  $\eta_{+-}$ .

#### KO MEAN LIFE

 $5.15 \pm 0.14$ DEVLIN 67 CNTR

<sup>1</sup> AMBROSINO 06 uses  $\phi \to K_L K_S$  with  $K_L$  tagged by  $K_S \to \pi^+\pi^-$ . The four major  $K_L$  BR's are measured, the small remainder  $(\pi^+\pi^-,\pi^0\pi^0,\gamma\gamma)$  is taken from PDG 04. This KLOE  $K_L$  lifetime is obtained by imposing  $\sum_i B_i = 1$ . The correlation matrix among the four measured  $K_L$  BR's and this  $K_L$  lifetime is  $K_{e3} = K_{\mu 3} = 3\pi^0 = \pi^+\pi^-\pi^0 = \tau_{K_L}$   $K_{e3} = K_{\mu 3} = 3\pi^0 = \pi^+\pi^-\pi^0 = \tau_{K_L}$   $K_{e3} = 1 = -0.25 = -0.56 = -0.07 = 0.25$   $K_{\mu 3} = 1 = -0.43 = -0.20 = 0.33$   $3\pi^0 = 1 = -0.39 = -0.21$ 

$$K_{e3}$$
  $K_{\mu 3}$   $3\pi^0$   $\pi^+\pi^-\pi^0$   $au_{K_L}$ 
 $K_{e3}$  1  $-0.25$   $-0.56$   $-0.07$   $0.25$ 
 $K_{\mu 3}$  1  $-0.43$   $-0.20$   $0.33$ 
 $3\pi^0$  1  $-0.39$   $-0.21$ 
 $\pi^+\pi^-\pi^0$  1  $-0.39$ 

These correlations are taken into account in our fit. The average of this KLOE mean life measurement and the independent KLOE measurement in AMBROSINO 05C is (5.084  $\pm$  $0.023) \times 10^{-8}$  s.

- [a] The value is for the sum of the charge states or particle/antiparticle states indicated.
- [b] This mode includes gammas from inner bremsstrahlung but not the direct emission mode  $K_I^0 \to \pi^+\pi^-\gamma(DE)$ .
- [c] See the Particle Listings below for the energy limits used in this measurement.
- [d] Most of this radiative mode, the low-momentum  $\gamma$  part, is also included in the parent mode listed without  $\gamma$ 's.
- [e] Allowed by higher-order electroweak interactions.
- [f] Violates *CP* in leading order. Test of direct *CP* violation since the indirect *CP*-violating and *CP*-conserving contributions are expected to be suppressed.

#### CONSTRAINED FIT INFORMATION

An overall fit to the mean life and 15 branching ratios uses 27 measurements and one constraint to determine 11 parameters. The overall fit has a  $\chi^2 = 37.4$  for 17 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients  $\left\langle \delta p_i \delta p_j \right\rangle / (\delta p_i \cdot \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

  $M_{ee} > 5$  MeV,  $E_{ee}^* > 30$  MeV

 $<sup>^{1}</sup>$  DONALDSON 74 uses  $K_{L}^{0} 
ightarrow ~\pi^{+}\pi^{-}\pi^{0}/($ all  $K_{L}^{0})$  decays = 0.126.

 $<sup>^1\,\</sup>text{E}^*_{ee}$  is the energy of the  $e^+\,e^-$  pair in the kaon rest frame. ABOUZAID 07C reports  $[\Gamma(K_L^0\to~\pi^\pm\,e^\mp\,\nu\,e^+\,e^-)/\Gamma(K_L^0\to~\pi^+\,\pi^-\,\pi^0)]~/~[B(\pi^0\to~e^+\,e^-\,\gamma)]=(8.54\pm0.07\pm0.13)\times10^{-3}$  which we multiply by our best value  $B(\pi^0\to~e^+\,e^-\,\gamma)=(1.174\pm0.035)\times10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>&</sup>lt;sup>2</sup> Internal Bremsstrahlung component only.

<sup>&</sup>lt;sup>3</sup> Direct  $\gamma$  emission component only.

<sup>&</sup>lt;sup>4</sup> Both IB and DE components.

<sup>&</sup>lt;sup>1</sup> ALAVI-HARATI 01B includes both Direct Emission (DE) and Inner Bremsstrahlung (IB) processes.

 $^1$  ABOUZAID 08 reports (1.29  $\pm$  0.03  $\pm$  0.05)  $\times$   $10^{-6}$  from a measurement of [ $\Gamma(K_L^0\to\pi^0\,2\gamma)/\Gamma_{total}$ ] / [B( $K_L^0\to\pi^0\,\pi^0$ )] assuming B( $K_L^0\to\pi^0\,\pi^0$ ) = (8.69  $\pm$  0.04)  $\times$  10<sup>-4</sup>, which we rescale to our best value B( $K_L^0\to\pi^0\,\pi^0$ ) = (8.64  $\pm$  0.06)  $\times$  10<sup>-4</sup>. Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>2</sup> LAI 02B reports  $[\Gamma(\kappa_L^0 \to \pi^0 2\gamma)/\Gamma_{\text{total}}] / [B(\kappa_L^0 \to \pi^0 \pi^0)] = (1.467 \pm 0.032 \pm 0.032) \times 10^{-3}$  which we multiply by our best value  $B(\kappa_L^0 \to \pi^0 \pi^0) = (8.64 \pm 0.06) \times 10^{-4}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. They also find that  $B(\pi^0 2\gamma, m_{\gamma\gamma} < 110 \text{ MeV}) < 0.6 \times 10^{-8} (90\% \text{ CL})$ .

<sup>3</sup> ALAVI-HARATI 99B finds that  $\Gamma(\pi^0 2\gamma, m_{\gamma\gamma} < 240 \text{ MeV})) / \Gamma(\pi^0 2\gamma) = (17.3 \pm 1.3 \pm 1.5)\%$ . Superseded by ABOUZAID 08.

 $<sup>^1</sup>$  Quadratic dependence required by some experiments. (See sections on "QUADRATIC COEFFICIENT h" and "QUADRATIC COEFFICIENT k" below.) Correlations prevent us from averaging results of fits not including  $g,\ h,$  and k terms.

 $<sup>^3</sup>$  BUCHANAN 70 result revised by BUCHANAN 75 to include radiative correlations and to use more reliable  $K_L^0$  momentum spectrum of second experiment (had same beam).

Linear coeff. g for  $K_L^0 \to \pi^+\pi^-\pi^0$  matrix element squared

 $<sup>^2</sup>$  BISI 74 value comes from quadratic fit with quad. term consistent with zero. g error is thus larger than if linear fit were used.

$$-6.1 \pm 0.9 \pm 0.5$$
 14.7M  $^2$  LAI 01B NA48  $-3.3 \pm 1.1 \pm 0.7$  5M  $^{2,3}$  SOMALWAR 92 E731

 $<sup>^{1}</sup>$  Quadratic coefficients h and k required by some experiments. (See section on "QUADRATIC COEFFICIENT k" below.) Correlations prevent us from averaging results of fits not including g, h, and k terms.

<sup>&</sup>lt;sup>1</sup>Result obtained using CI3pI model of CABIBBO 05 to include  $\pi\pi$  rescattering effects. The systematic error includes an external error of  $1.06 \times 10^{-3}$  from the parametrization input of (a $_0$ -a $_2$ )  $m_{\pi^+}=$  0.268  $\pm$  0.017 from BATLEY 06B.

 $<sup>^2</sup>$ LAI 01B and SOMALWAR 92 results do not include  $\pi\pi$  final state rescattering effects.

 $<sup>^3</sup>$  SOMALWAR 92 chose  $m_{\pi^+}$  as normalization to make it compatible with the Particle Data Group  $K_I^0 \rightarrow \pi^+ \pi^- \pi^0$  definitions.

#### $K_i^0$ FORM FACTORS

For discussion, see note on form factors in the  $K^{\pm}$  section of the Particle Listings above.

In the form factor comments, the following symbols are used.

 $f_{\perp}$  and  $f_{\perp}$  are form factors for the vector matrix element.

 $f_{S}$  and  $f_{T}$  refer to the scalar and tensor term.

$$f_0(t) = f_+(t) + f_-(t) t/(m_{\kappa_0}^2 - m_{\pi^+}^2).$$

t= momentum transfer to the  $\pi.$ 

 $\lambda_{+}$  and  $\lambda_{0}$  are the linear expansion coefficients of  $f_{+}$  and  $f_{0}$ :

$$f_{+}(t) = f_{+}(0) (1 + \lambda_{+} t / m_{\pi^{+}}^{2})$$

For quadratic expansion

$$f_{+}(t) = f_{+}(0) \left(1 + \lambda'_{+} t / m_{\pi^{+}}^{2} + \frac{\lambda''_{+}}{2} t^{2} / m_{\pi^{+}}^{4}\right)$$

as used by KTeV. If there is a non-vanishing quadratic term, then  $\lambda_{\perp}$ 

represents an average slope, which is then different from  $\lambda'_{+}$ .

NA48 ( $K_{e3}$ ) and ISTRA quadratic expansion coefficients are converted with

$$\lambda'_{+} \stackrel{PDG}{=} \lambda_{+} \stackrel{NA48}{=} \text{ and } \lambda''_{+} \stackrel{PDG}{=} 2 \lambda'_{+} \stackrel{NA48}{=} \lambda'_{+} \stackrel{PDG}{=} (\frac{m_{\pi^{+}}}{m_{\pi^{0}}})^{2} \lambda_{+} \stackrel{ISTRA}{=} \text{ and } \lambda''_{+} \stackrel{PDG}{=} 2 (\frac{m_{\pi^{+}}}{m_{\pi^{0}}})^{4} \lambda'_{+} \stackrel{ISTRA}{=}$$

ISTRA linear expansion coefficients are converted with 
$$\lambda_+^{PDG}=(\frac{m_{\pi^+}}{m_{\pi^0}})^2~\lambda_+^{ISTRA}$$
 and  $\lambda_0^{PDG}=(\frac{m_{\pi^+}}{m_{\pi^0}})^2~\lambda_0^{ISTRA}$ 

The pole parametrization is

$$f_{+}(t) = f_{+}(0) \left( \frac{M_V^2}{M_V^2 - t} \right)$$

$$f_0(t) = f_0(0) \left( \frac{M_S^2}{M_S^2 - t} \right)$$

where  $M_V$  and  $M_S$  are the vector and scalar pole masses.

The dispersive parametrization is

$$f_{+}(t) = f_{+}(0) \exp\left[\frac{t}{m_{\pi}^{2}} (\Lambda_{+} + H(t))\right];$$
  
 $f_{0}(t) = f_{+}(0) \exp\left[\frac{t}{m_{K}^{2} - m_{\pi}^{2}} (\ln[C] - G(t))\right],$ 

where  $\Lambda_{+}$  is the slope parameter and  $\ln[C] = \ln[f_0 (m_K^2 - m_\pi^2)]$ 

is the logarithm of the scalar form factor at the Callan-Treiman point

Created: 5/30/2017 17:22

H(t) and G(t) are dispersive integrals.

The following abbreviations are used:

DP = Dalitz plot analysis.

 $PI = \pi$  spectrum analysis.

 $MU = \mu$  spectrum analysis.

POL=  $\mu$  polarization analysis.

BR =  $K_{\mu 3}^0/K_{e3}^0$  branching ratio analysis.

E = positron or electron spectrum analysis.

RC = radiative corrections.

#### $\lambda_+$ (LINEAR ENERGY DEPENDENCE OF $f_+$ IN $K_{e3}^0$ DECAY)

For radiative correction of  $K_{e3}^0$  DP, see GINSBERG 67, BECHERRAWY 70, CIRIGLIANO 02, CIRIGLIANO 04, and ANDRE 07. Results labeled OUR FIT are discussed in the review " $K_{\ell3}^\pm$  and  $K_{\ell3}^0$  Form Factors" in the  $K^\pm$  Listings. For earlier, lower statistics results, see the 2004 edition of this review, Physics Letters **B592** 1 (2004).

# $\alpha_{K*}^{\text{eff}}$ DECAY FORM FACTOR FOR $K_L \rightarrow e^+e^-e^+e^-$

 $lpha_{K^*}^{ ext{eff}}$  is the parameter describing the relative strength of an intermediate pseudoscalar decay amplitude and a vector meson decay amplitude in the model of BERGSTROM 83. It takes into account both the radiative effects and the form factor. Since there are two  $e^+e^-$  pairs here compared with one in  $e^+e^-\gamma$  decays, a factorized expression is used for the  $e^+e^-e^+e^-$  decay form factor.

## CP-VIOLATION PARAMETERS IN $K_L^0$ DECAYS

# - Charge asymmetry in $K_{\ell 3}^0$ decays ———

Such asymmetry violates *CP*. It is related to  $Re(\epsilon)$ .

 $A_L$  = weighted average of  $A_L(\mu)$  and  $A_L(e)$  In previous editions and in the literature the symbol used for this asymmetry was  $\delta_L$  or  $\delta$ . We use  $A_L$  for consistency with  $B^0$  asymmetry notation and with recent  $\kappa^0_S$ notation.

 $^1$  Value obtained from the NA48 measurements of  $\Gamma(K_L^0\to\pi^+\pi^-)/\Gamma(K_L^0\to\pi\,e\nu_e)$  and  $\tau_{K_S^0}$  and KLOE measurements of B( $K_S^0\to\pi^+\pi^-$ ) and  $\tau_{K_L^0}$ .  $\Gamma(K_L^0\to\pi^+\pi^-)$  is defined to include the inner bremsstrahlung component  $\Gamma(K_L^0\to\pi^+\pi^-\gamma({\rm IB}))$  but exclude the direct emission component B( $K_S^0\to\pi^+\pi^-({\rm DE})$ ). Their  $|\eta_{+-}|$  value is not directly used in our fit, but enters the fit via their branching ratio and lifetime measurements.

<sup>2</sup> AMBROSINO 06F uses KLOE branching ratios and  $\tau_L$  together with  $\tau_S$  from PDG 04. Their  $|\eta_{+-}|$  value is not directly used in our fit, but enters the fit via their branching ratio and lifetime measurements.

<sup>3</sup> ALEXOPOULOS 04  $|\eta_{+-}|$  uses their  $K_L^0 \to \pi\pi$  branching fractions,  $\tau_S = (0.8963 \pm 0.0005) \times 10^{-10}$  s from the average of KTeV and NA48  $\tau_S$  measurements, and assumes that  $\Gamma(K_S^0 \to \pi\ell\nu_\ell) = \Gamma(K_L^0 \to \pi\ell\nu_\ell)$  giving B( $K_S^0 \to \pi\ell\nu_\ell$ ) = 0.118%. Their  $\eta_{+-}$  is not directly used in our fit, but enters our fit via their branching ratio measurements.

<sup>4</sup> APOSTOLAKIS 99C report (2.264  $\pm$  0.023  $\pm$  0.026 + 9.1[ $au_s$  - 0.8934]) imes 10<sup>-3</sup>. We evaluate for our 2006 best value  $au_s$  = (0.8958  $\pm$  0.0005) imes 10<sup>-10</sup> s.

 $^5$  ADLER 95B report (2.312  $\pm\,0.043\,\pm\,0.030\,-1[\Delta m-0.5274]\,+9.1[\tau_{\rm S}-0.8926])\times10^{-3}$  . We evaluate for our 1996 best values  $\Delta m=(0.5304\,\pm\,0.0014)\times10^{-10}\,\hbar{\rm s}^{-1}$  and  $\tau_{\rm S}=(0.8927\,\pm\,0.0009)\times10^{-10}$  s. Superseded by APOSTOLAKIS 99C.

#### $|\epsilon| = (2|\eta_{+-}| + |\eta_{00}|)/3$

This expression is a very good approximation, good to about one part in  $10^{-4}$  because of the small measured value of  $\phi_{00}-\phi_{+-}$  and small theoretical ambiguities.

VALUE (units 10<sup>-3</sup>) DOCUMENT ID

2.228 ± 0.011 OUR FIT Error includes scale factor of 1.8.

 $<sup>^2</sup>$  CHOLLET 70 gives  $|\eta_{00}|=(1.23\pm0.24)\times ({\rm regeneration~amplitude},~2~{\rm GeV}/c~{\rm Cu})/10000{\rm mb}.$  WOLFF 71 gives  $|\eta_{00}|=(1.13\pm0.12)\times ({\rm regeneration~amplitude},~2~{\rm GeV}/c~{\rm Cu})/10000{\rm mb}.$  We compute both  $|\eta_{00}|$  values for (regeneration amplitude, 2  ${\rm GeV}/c~{\rm Cu})=24\pm2{\rm mb}.$  This regeneration amplitude results from averaging over FAISSNER 69, extrapolated using optical-model calculations of Bohm et al., Physics Letters **27B** 594 (1968) and the data of BALATS 71. (From H. Faissner, private communication).

<sup>&</sup>lt;sup>1</sup> The two ABOUZAID 11 values use the same data. The fits are performed with and without *CPT* invariance requirement.

 $<sup>^{</sup>m 1}$  This is the square root of the ratio R given by BURKHARDT 88 and BARR 93D.

<sup>&</sup>lt;sup>2</sup> This is the combined results from BARR 93D and BURKHARDT 88, taking into account a common systematic uncertainty of 0.0014.

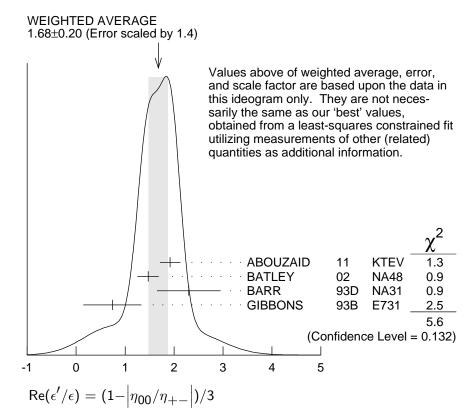

<sup>&</sup>lt;sup>3</sup> We calculate  $|\eta_{00}/\eta_{+-}|=1-3(\epsilon'/\epsilon)$  from WOODS 88  $(\epsilon'/\epsilon)$  value.

<sup>&</sup>lt;sup>2</sup> These values are derived from  $|\eta_{00}/\eta_{+-}|$  measurements. They enter the average in this section but enter the fit via the  $|\eta_{00}/\eta_{+-}|$  only.

<sup>&</sup>lt;sup>3</sup> This is the combined results from BARR 93D and BURKHARDT 88, taking into account their common systematic uncertainty.

<sup>&</sup>lt;sup>4</sup> We use ABOUZAID 11 Re( $\epsilon'/\epsilon$ ) value with *CPT* assumption in our fits for  $|\eta_{+-}|$ ,  $|\eta_{00}|$ , and Re( $\epsilon'/\epsilon$ ).

 $<sup>^5\,\</sup>mathrm{These}$  values are derived from  $\left|\eta_{00}/\eta_{+-}\right|$  measurements.

### $\phi_{+-}$ , PHASE of $\eta_{+-}$

The dependence of the phase on  $\Delta m$  and  $\tau_S$  is given for each experiment in the comments below, where  $\Delta m$  is the  $K_L^0-K_S^0$  mass difference in units  $10^{10}~\hbar {\rm s}^{-1}$  and  $\tau_S$  is the  $K_S$  mean life in units  $10^{-10}$  s. We also give the regeneration phase  $\phi_f$  in the comments below.

OUR FIT is described in the note on "CP violation in  $K_L$  decays" in the  $K_L^0$  Particle Listings. Most experiments in this section are included in both the "Not Assuming CPT" and "Assuming CPT" fits. In the latter fit, they have little direct influence on  $\phi_{+-}$  because their errors are large compared to that assuming CPT, but they influence  $\Delta m$  and  $\tau_s$  through their dependencies on these parameters, which are given in the footnotes.

- $^1$  APOSTOLAKIS 99C measures  $\phi_{+-}=(43.19\pm0.53\pm0.28)\,+\,300\,[\Delta m-\,0.5301]$  (°). We have adjusted the measurement to use our best values of ( $\Delta m=0.5293\pm0.0009$ ) ( $10^{10}\,\,\hbar\,\,\mathrm{s}^{-1}$ ). Our first error is their experiment's error and our second error is the systematic error from using our best values.
- $^2$  SCHWINGENHEUER 95 measures  $\phi_{+-}=(43.53\pm0.76)\,+173\,[\Delta m-\,0.5282]\,-275\,[\tau_s-\,0.8926]$  (°). We have adjusted the measurement to use our best values of  $(\Delta m=\,0.5293\pm0.0009)\,(10^{10}\,\,\hbar\,\,\mathrm{s}^{-1}),\,(\tau_s=0.8954\pm0.0004)\,(10^{-10}\,\,\mathrm{s}).$  Our first error is their experiment's error and our second error is the systematic error from using our best values.
- <sup>3</sup> These experiments measure  $\phi_{+-}-\phi_f$  and calculate the regeneration phase from the power law momentum dependence of the regeneration amplitude using analyticity and dispersion relations. SCHWINGENHEUER 95 [GIBBONS 93] includes a systematic error of  $0.35^{\circ}$  [0.5°] for uncertainties in their modeling of the regeneration amplitude.
- $^4$  GIBBONS 93 measures  $\phi_{+-}=(42.21\pm0.9)+189~[\Delta m-0.5257]-460~[\tau_s-0.8922]$  (°). We have adjusted the measurement to use our best values of  $(\Delta m=0.5293\pm0.0009)~(10^{10}~\hbar~s^{-1}),~(\tau_s=0.8954\pm0.0004)~(10^{-10}~s).$  Our first error is their experiment's error and our second error is the systematic error from using our best values. This is actually reported in SCHWINGENHEUER 95, footnote 8. GIBBONS 93 reports  $\phi_{+-}$  (42.2  $\pm$  1.4)°. They measure  $\phi_{+}$ - $\phi_{f}$  and calculate the regeneration phase  $\phi_{f}$  from the power law momentum dependence of the regeneration amplitude using analyticity. An error of  $0.6^\circ$  is included for possible uncertainties in the regeneration phase.
- <sup>5</sup>CAROSI 90 measures  $\phi_{+-}=(46.9\pm1.4\pm0.7)+579~[\Delta m-0.5351]+303~[\tau_s-0.8922]$  (°). We have adjusted the measurement to use our best values of ( $\Delta m=0.5293\pm0.0009$ ) ( $10^{10}~\hbar~s^{-1}$ ), ( $\tau_s=0.8954\pm0.0004$ ) ( $10^{-10}~s$ ). Our first error is their experiment's error and our second error is the systematic error from using our best values.
- <sup>6</sup> GEWENIGER 74B measures  $\phi_{+-}=(49.4\pm1.0)~+565~[\Delta m-~0.540]$  (°). We have adjusted the measurement to use our best values of ( $\Delta m=0.5293\pm0.0009$ ) ( $10^{10}~\hbar~s^{-1}$ ). Our first error is their experiment's error and our second error is the systematic error from using our best values.
- <sup>7</sup> Not independent of other phase parameters reported in ABOUZAID 11.
- <sup>8</sup> ALAVI-HARATI 03  $\phi_{+-}$  is correlated with their  $\Delta m = m_{K_L^0} m_{K_S^0}$  and  $\tau_{K_S}$  measurements in the  $K_L^0$  and  $K_S^0$  sections respectively. The correlation coefficients are  $\rho(\phi_{+-},\Delta m)$ =+0.955,  $\rho(\phi_{+-},\tau_S)$ =-0.871, and  $\rho(\tau_S,\Delta m)$ =-0.840. *CPT* is not assumed. Uses scintillator Pb regenerator. Superseded by ABOUZAID 11.
- <sup>9</sup>ADLER 96C measures  $\phi_{+-}=(43.82\pm0.41)+339~[\Delta m-0.5307]-252~[\tau_s-0.8922]$  (°). We have adjusted the measurement to use our best values of ( $\Delta m=0.5293\pm0.0009$ ) ( $10^{10}~\hbar~s^{-1}$ ), ( $\tau_s=0.8954\pm0.0004$ ) ( $10^{-10}~s$ ). Our first error is their experiment's error and our second error is the systematic error from using our best values.
- 10 ADLER 96C is the result of a fit which includes nearly the same data as entered into the "OUR FIT" value in the 1996 edition of this Review (Physical Review **D54** 1 (1996)).
- <sup>11</sup> ADLER 95B measures  $\phi_{+-}=(42.7\pm0.9\pm0.6)+316$  [ $\Delta m-0.5274$ ] +30 [ $\tau_{s}-0.8926$ ] (°). We have adjusted the measurement to use our best values of ( $\Delta m=0.5293\pm0.0009$ ) ( $10^{10}~\hbar~s^{-1}$ ), ( $\tau_{s}=0.8954\pm0.0004$ ) ( $10^{-10}~s$ ). Our first error is their experiment's error and our second error is the systematic error from using our best values.
- <sup>12</sup> ADLER 92B quote separately two systematic errors:  $\pm 0.4$  from their experiment and  $\pm 1.0$  degrees due to the uncertainty in the value of  $\Delta m$ .
- $^{13}$  KARLSSON 90 systematic error does not include regeneration phase uncertainty.

<sup>14</sup> CARITHERS 75 measures  $\phi_{+-} = (45.5 \pm 2.8) + 224 [\Delta m - 0.5348]$  (°). We have adjusted the measurement to use our best values of ( $\Delta m = 0.5293 \pm 0.0009$ ) ( $10^{10} \ \hbar$  $s^{-1}$ ). Our first error is their experiment's error and our second error is the systematic error from using our best values.  $\phi_f = -40.9 \pm 2.6^{\circ}$ .

#### $\phi_{00}$ , PHASE OF $\eta_{00}$

See comment in  $\phi_{+-}$  header above for treatment of  $\Delta m$  and  $au_{s}$  dependence, as well as for the inclusion of data in both the "Assuming CPT" and "Not Assuming CPT"

OUR FIT is described in the note on "CP violation in  $K_L$  decays" in the  $K_L^0$  Particle

$0.30 \pm 0.35$	<sup>3</sup> ABOUZAID 11	KTEV Not assuming CPT
$0.39\ \pm0.22\ \pm0.45$	<sup>4</sup> ALAVI-HARATI03	KTEV
$0.62\ \pm0.71\ \pm0.75$	SCHWINGEN95	E773
$-1.6$ $\pm 1.2$	<sup>5</sup> GIBBONS 93	E731
$0.2 \pm 2.6 \pm 1.2$	<sup>6</sup> CAROSI 90	NA31
$-0.3$ $\pm 2.4$ $\pm 1.2$	KARLSSON 90	E731

 $<sup>^1</sup>$  SUPERWEAK 16 is a fake experiment to constrain  $\phi_{00}-\phi_{+-}$  to a small value as described in the note "CP violation in  $K_L$  decays."

<sup>&</sup>lt;sup>2</sup>SANDWEISS 73 value corrected from value quoted in their paper due to new value of  $Re(\xi)$ . See footnote 4 of SCHMIDT 79.

 $<sup>^2\,\</sup>text{This}$  SCHWINGENHEUER 95 values is the combined result of SCHWINGENHEUER 95 and GIBBONS 93, accounting for correlated systematic errors.

 $<sup>^3</sup>$  Not independent of other phase parameters reported in ABOUZAID 11.

 $<sup>^4</sup>$  ALAVI-HARATI 03 fit Re( $\epsilon'/\epsilon$ ), Im( $\epsilon'/\epsilon$ ),  $\Delta m,~\tau_{\mbox{\it S}},~$  and  $\phi_{+-}$  simultaneously, not assuming *CPT*. Phase difference is obtained from  $\phi_{00}-\phi_{+-}\approx -3\mathrm{Im}(\epsilon'/\epsilon)$  for small  $|\epsilon'/\epsilon|$ . Superseded by ABOUZAID 11.

 $<sup>^{5}\,\</sup>text{GIBBONS}$  93 give detailed dependence of systematic error on lifetime (see the section on the  $K_S^0$  mean life) and mass difference (see the section on  $m_{K_I^0}-m_{K_S^0}$ ).

 $<sup>^6</sup>$  CAROSI 90 is excluded from the fit because it it is not independent of  $\phi_{+-}$  and  $\phi_{00}$ values.

#### PHASE DIFFERENCE $\phi_{+-} - \phi_{SW}$

Test of *CPT*. The Superweak phase  $\phi_{\sf SW} \equiv \tan^{-1}{(2\Delta m/\Delta\Gamma)}$  where  $\Delta m = m_{{\cal K}^0_I} - m_{{\cal K}^0_I}$  $m_{K_S^0}$  and  $\Delta\Gamma=\hbar( au_L- au_S)/( au_L au_S).$ 

VALUE (°)  $0.61 \pm 0.62 \pm 1.01$ 

# $Re(\frac{2}{3}\eta_{+-} + \frac{1}{3}\eta_{00}) - \frac{A_L}{2}$ Test of *CPT*

VALUE (units  $10^{-6}$ )

# $\Delta S = \Delta Q$ IN $K^0$ DECAYS

The relative amount of  $\Delta S \neq \Delta Q$  component present is measured by the parameter x, defined as

$$x = A(\overline{K}^0 \to \pi^- \ell^+ \nu) / A(K^0 \to \pi^- \ell^+ \nu)$$
.

We list  $Re\{x\}$  and  $Im\{x\}$  for  $K_{e3}$  and  $K_{\mu3}$  combined.

# $x = A(\overline{K}^0 \rightarrow \pi^- \ell^+ \nu)/A(K^0 \rightarrow \pi^- \ell^+ \nu) = A(\Delta S = -\Delta Q)/A(\Delta S = \Delta Q)$

#### REAL PART OF x
