ρ (770) RANGE PARAMETER

The range parameter R enters an energy-dependent correction to the width, of the form $(1+q_r^2\,R^2)/(1+q^2\,R^2)$, where q is the momentum of one of the pions in the $\pi\pi$ rest system. At resonance, $q=q_r$.

CONSTRAINED FIT INFORMATION

An overall fit to the total width and a partial width uses 10 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2=10.7$ for 8 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients $\left\langle \delta p_i \delta p_j \right\rangle / (\delta p_i \cdot \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

   <sup>1</sup> Possibly large \rho-\omega interference leads us to increase the minus error.
   ^2Result contains 11\pm11\% correction using SU(3) for central value. The error on the
     correction takes account of possible \rho-\omega interference and the upper limit agrees with the
     upper limit of \omega \to \mu^+ \mu^- from this experiment.
   ^3 HYAMS 67's mass resolution is 20 MeV. The \omega region was excluded.
   <sup>4</sup> The \rho' contribution is not taken into account.
   <sup>5</sup> ACHASOV 07B reports [\Gamma(\rho(770) \rightarrow \eta \gamma)/\Gamma_{\text{total}}] \times [B(\rho(770) \rightarrow e^+e^-)] = (1.32 \pm 0.14 \pm 0.08) \times 10^{-8} which we divide by our best value B(\rho(770) \rightarrow e^+e^-)
     = (4.72 \pm 0.05) \times 10^{-5}. Our first error is their experiment's error and our second
     error is the systematic error from using our best value. Supersedes ACHASOV 00D and
     ACHASOV 06A.
   <sup>6</sup> Solution corresponding to constructive \omega-\rho interference.
   <sup>7</sup> Using B(\rho \rightarrow e^+e^-) = (4.67 \pm 0.09) \times 10<sup>-5</sup> and B(\eta \rightarrow \gamma \gamma) = 39.43 \pm 0.26%. <sup>8</sup> Not independent of the corresponding \Gamma(e^+e^-) \times \Gamma(\eta \gamma)/\Gamma_{\text{total}}^2.

- ¹⁰ Using B($\rho \to e^+e^-$) = (4.75 \pm 0.10) \times 10⁻⁵ from AKHMETSHIN 02 and B($\eta \to 3\pi^0$) = (32.24 \pm 0.29) \times 10⁻².
- 11 Reanalysis of DRUZHININ 84, DOLINSKY 89, and DOLINSKY 91 taking into account a triangle anomaly contribution. Constructive ρ - ω interference solution.
- 12 Statistical significance is less than 3σ .
- 13 Model dependent, assumes $I=1,\,2,\,{
 m or}\,\,3$ for the 3π system.
- ¹⁴ Assuming no interference between the ρ and ω contributions.
- 15 Bremsstrahlung from a decay pion and for photon energy above 50 MeV.
- ¹⁶ Superseded by DOLINSKY 91.
- ¹⁷ Structure radiation due to quark rearrangement in the decay.
- ¹⁸ Using B($\rho \rightarrow e^+e^-$) from PDG 15. Supersedes ACHASOV 03.
- ¹⁹ Using B($\rho \to e^+e^-$) = (4.67 \pm 0.09) \times 10⁻⁵.
- Not independent of the corresponding $\Gamma(e^+e^-) \times \Gamma(\pi^0 \gamma)/\Gamma_{\text{total}}^2$
- ²¹ Using B($\rho \rightarrow e^+e^-$) = (4.54 ± 0.10) × 10⁻⁵.
- Reanalysis of DRUZHININ 84, DOLINSKY 89, and DOLINSKY 91 taking into account a triangle anomaly contribution.
- ²³ This branching ratio includes the conventional VMD mechanism $\rho \to \omega \pi^0$, $\omega \to \pi^0 \gamma$, and the new decay mode $\rho \to f_0(500)\gamma$, $f_0(500) \to \pi^0 \pi^0$ with a branching ratio $(2.0^{+1.1}_{-0.9} \pm 0.3) \times 10^{-5}$ differing from zero by 2.0 standard deviations.
- ²⁴ This branching ratio includes the conventional VMD mechanism $\rho \to \omega \pi^0$, $\omega \to \pi^0 \gamma$ and the new decay mode $\rho \to f_0(500)\gamma$, $f_0(500) \to \pi^0 \pi^0$ with a branching ratio $(1.9^{+0.9}_{-0.8} \pm 0.4) \times 10^{-5}$ differing from zero by 2.4 standard deviations. Supersedes ACHASOV 00G.
- 25 Superseded by ACHASOV 02F.
