Most decay modes (other than the semileptonic modes) that involve a neutral K meson are now given as K_S^0 modes, not as \overline{K}^0 modes. Nearly always it is a K_S^0 that is measured, and interference between Cabibbo-allowed and doubly Cabibbo-suppressed modes can invalidate the assumption that $2\Gamma(K_S^0)=\Gamma(\overline{K}^0)$.

Most decay modes (other than the semileptonic modes) that involve a neutral K meson are now given as K_S^0 modes, not as \overline{K}^0 modes. Nearly always it is a K_S^0 that is measured, and interference between Cabibbo-allowed and doubly Cabibbo-suppressed modes can invalidate the assumption that $2\Gamma(K_S^0)=\Gamma(\overline{K}^0)$.

BOTTOM MESONS $(B = \pm 1)$

 $B^+ = u\overline{b}$, $B^0 = d\overline{b}$, $\overline{B}^0 = \overline{d}b$, $B^- = \overline{u}b$, similarly for B^* 's

B-particle organization

Many measurements of B decays involve admixtures of B hadrons. Previously we arbitrarily included such admixtures in the B^\pm section, but because of their importance we have created two new sections: " B^\pm/B^0 Admixture" for $\Upsilon(4S)$ results and " $B^\pm/B^0/B_s^0/b$ -baryon Admixture" for results at higher energies. Most inclusive decay branching fractions and χ_b at high energy are found in the Admixture sections. $B^0-\overline{B}^0$ mixing data are found in the B^0 section, while $B_s^0-\overline{B}^0$ mixing data and $B-\overline{B}$ mixing data for a B^0/B_s^0 admixture are found in the B_s^0 section. CP-violation data are found in the B^\pm , B^0 , and B^\pm B^0 Admixture sections. b-baryons are found near the end of the Baryon section.

The organization of the *B* sections is now as follows, where bullets indicate particle sections and brackets indicate reviews.

 \bullet B^{\pm} mass, mean life, CP violation, branching fractions \bullet B^0

mass, mean life, B^0 - \overline{B}^0 mixing, CP violation, branching fractions

- B^{\pm}/B^0 Admixtures CP violation, branching fractions
- $B^{\pm}/B^0/B_s^0/b$ -baryon Admixtures mean life, production fractions, branching fractions
- B* mass
- $B_1(5721)^+$ mass
- $B_1(5721)^0$ mass
- $B_2^*(5747)^+$ mass
- $B_2^*(5747)^0$ mass
- $B_J^*(5970)^+$ mass
- $B_J^*(5970)^0$ mass
- B_s^0 mass, mean life, B_s^0 - \overline{B}_s^0 mixing, CP violation, branching fractions
- B_s^* mass
- $B_{s1}(5830)^0$

mass

- $B_{s2}^* (5840)^0$ mass
- $\bullet B_c^{\pm}$

mass, mean life, branching fractions

At the end of Baryon Listings:

Λ_b
 mass, mean life, branching fractions

- $\Lambda_b(5912)^0$ mass, mean life
- $\Lambda_b(5920)^0$ mass, mean life
- \bullet Σ_b mass
- \bullet Σ_b^* mass
- $\bullet \equiv_b^0, \equiv_b^-$

mass, mean life, branching fractions

- $\Xi_b'(5935)^-$ mass
- $\Xi_b(5945)^0$ mass
- $\Xi_b^*(5955)^-$ mass
- $\bullet \Omega_b^-$

mass, branching fractions

 b-baryon Admixture mean life, branching fractions

 B^- modes are charge conjugates of the modes below. Modes which do not identify the charge state of the B are listed in the B^\pm/B^0 ADMIXTURE section.

The branching fractions listed below assume 50% $B^0\overline{B}^0$ and 50% B^+B^- production at the $\Upsilon(4S)$. We have attempted to bring older measurements up to date by rescaling their assumed $\Upsilon(4S)$ production ratio to 50:50 and their assumed D, D_S , D^* , and ψ branching ratios to current values whenever this would affect our averages and best limits significantly.

Indentation is used to indicate a subchannel of a previous reaction. All resonant subchannels have been corrected for resonance branching fractions to the final state so the sum of the subchannel branching fractions can exceed that of the final state.

For inclusive branching fractions, e.g., $B \to D^{\pm}$ anything, the values usually are multiplicities, not branching fractions. They can be greater than one.

 \overline{B}^0 modes are charge conjugates of the modes below. Reactions indicate the weak decay vertex and do not include mixing. Modes which do not identify the charge state of the B are listed in the B^\pm/B^0 ADMIXTURE section.

The branching fractions listed below assume 50% $B^0\overline{B}^0$ and 50% B^+B^- production at the $\Upsilon(4S)$. We have attempted to bring older measurements up to date by rescaling their assumed $\Upsilon(4S)$ production ratio to 50:50 and their assumed D, D_S , D^* , and ψ branching ratios to current values whenever this would affect our averages and best limits significantly.

Indentation is used to indicate a subchannel of a previous reaction. All resonant subchannels have been corrected for resonance branching fractions to the final state so the sum of the subchannel branching fractions can exceed that of the final state.

For inclusive branching fractions, e.g., $B \to D^{\pm}$ anything, the values usually are multiplicities, not branching fractions. They can be greater than one.

$$A_{CP}(B \to \eta \text{ anything}) = -0.13^{+0.04}_{-0.05}$$

$$\Delta A_{CP}(X_s \gamma) = A_{CP}(B^\pm \to X_s \gamma) - A_{CP}(B^0 \to X_s \gamma) = 0.05 \pm 0.04$$

The branching fraction measurements are for an admixture of B mesons at the $\Upsilon(4S)$. The values quoted assume that B($\Upsilon(4S) \rightarrow B\overline{B}$) = 100%.

For inclusive branching fractions, e.g., $B \to D^\pm$ anything, the treatment of multiple D's in the final state must be defined. One possibility would be to count the number of events with one-or-more D's and divide by the total number of B's. Another possibility would be to count the total number of D's and divide by the total number of B's, which is the definition of average multiplicity. The two definitions are identical if only one D is allowed in the final state. Even though the "one-or-more" definition seems sensible, for practical reasons inclusive branching fractions are almost always measured using the multiplicity definition. For heavy final state particles, authors call their results inclusive branching fractions while for light particles some authors call their results multiplicities. In the B sections, we list all results as inclusive branching fractions, adopting a multiplicity definition. This means that inclusive branching fractions can exceed 100% and that inclusive partial widths can exceed total widths, just as inclusive cross sections can exceed total cross section.

 \overline{B} modes are charge conjugates of the modes below. Reactions indicate the weak decay vertex and do not include mixing.

$$au_{
m charged\ b-hadron}/ au_{
m neutral\ b-hadron}=1.09\pm0.13 \ \left|\Delta au_b
ight|/ au_{b,\overline{b}}=-0.001\pm0.014 \
m Re(\epsilon_b)\ /\ (1+|\epsilon_b|^2)=(1.2\pm0.4) imes10^{-3}$$

The branching fraction measurements are for an admixture of B mesons and baryons at energies above the $\Upsilon(4S)$. Only the highest energy results (LHC, LEP, Tevatron, $Sp\overline{p}S$) are used in the branching fraction averages. In the following, we assume that the production fractions are the same at the LHC, LEP, and at the Tevatron.

For inclusive branching fractions, e.g., $B \to D^{\pm}$ anything, the values usually are multiplicities, not branching fractions. They can be greater than one.

The modes below are listed for a \overline{b} initial state. b modes are their charge conjugates. Reactions indicate the weak decay vertex and do not include mixing.

Fraction (Γ_i/Γ)

Scale factor/ pConfidence level (MeV/c)

PRODUCTION FRACTIONS

The production fractions for weakly decaying b-hadrons at high energy have been calculated from the best values of mean lives, mixing parameters, and branching fractions in this edition by the Heavy Flavor Averaging Group (HFLAV) as described in the note " B^0 - \overline{B}^0 Mixing" in the B^0 Particle Listings. The production fractions in b-hadronic Z decay or $p\overline{p}$ collisions at the Tevatron are also listed at the end of the section. Values assume

$$\begin{array}{ll} \mathsf{B}(\overline{b} \to B^+) = \mathsf{B}(\overline{b} \to B^0) \\ \mathsf{B}(\overline{b} \to B^+) + \mathsf{B}(\overline{b} \to B^0) + \mathsf{B}(\overline{b} \to B^0_s) + \mathsf{B}(b \to b\text{-baryon}) = 100\%. \end{array}$$

The correlation coefficients between production fractions are also reported:

$$cor(B_s^0, b\text{-baryon}) = -0.254$$

 $cor(B_s^0, B^{\pm} = B^0) = -0.143$
 $cor(b\text{-baryon}, B^{\pm} = B^0) = -0.921.$

The notation for production fractions varies in the literature $(f_d, d_{B^0}, f(b \to \overline{B}^0), \operatorname{Br}(b \to \overline{B}^0))$. We use our own branching fraction notation here, $\operatorname{B}(\overline{b} \to B^0)$.

Note these production fractions are b-hadronization fractions, not the conventional branching fractions of b-quark to a B-hadron, which may have considerable dependence on the initial and final state kinematic and production environment.

B^+	(40.4 ± 0.6) % -
B^0	(40.4 ± 0.6) % -

CP violation parameters in B_s^0

$$\begin{array}{l} \operatorname{Re}(\epsilon_{B_s^0}) \ / \ (1 + \left| \epsilon_{B_s^0} \right|^2) = (-0.15 \pm 0.70) \times 10^{-3} \\ C_{KK}(B_s^0 \to K^+ K^-) = 0.14 \pm 0.11 \\ S_{KK}(B_s^0 \to K^+ K^-) = 0.30 \pm 0.13 \\ \gamma = (65 \pm 7)^\circ \\ \delta_B(B_s^0 \to D_s^\pm K^\mp) = (3 \pm 20)^\circ \\ r_B(B_s^0 \to D_s^\mp K^\pm) = 0.53 \pm 0.17 \\ CP \ \text{Violation phase} \ \beta_s = (1.5 \pm 1.6) \times 10^{-2} \ \text{rad} \\ \left| \lambda \right| \ (B_s^0 \to J/\psi(1S)\phi) = 0.964 \pm 0.020 \\ \left| \lambda \right| = 1.03_{-0.04}^{+0.05} \\ A, \ CP \ \text{violation parameter} = 0.5_{-0.7}^{+0.8} \\ C, \ CP \ \text{violation parameter} = -0.3 \pm 0.4 \\ S, \ CP \ \text{violation parameter} = -0.1 \pm 0.4 \\ A_{CP}^L(B_s \to J/\psi \overline{K}^*(892)^0) = -0.05 \pm 0.06 \\ A_{CP}^{\parallel}(B_s \to J/\psi \overline{K}^*(892)^0) = 0.17 \pm 0.15 \\ A_{CP}^{\perp}(B_s \to J/\psi \overline{K}^*(892)^0) = -0.05 \pm 0.10 \\ A_{CP}(B_s \to \pi^+ K^-) = 0.26 \pm 0.04 \\ \end{array}$$

$$A_{CP}(B_s^0 \to [K^+K^-]_D \overline{K}^*(892)^0) = -0.04 \pm 0.07$$

 $A_{CP}(B_s^0 \to [\pi^+K^-]_D K^*(892)^0) = -0.01 \pm 0.04$
 $A_{CP}(B_s^0 \to [\pi^+\pi^-]_D K^*(892)^0) = 0.06 \pm 0.13$
 $A^{\Delta}(B_s \to \phi \gamma) = -1.0 \pm 0.5$
 $\Delta a_{\perp} < 1.2 \times 10^{-12} \text{ GeV}, \text{ CL} = 95\%$
 $\Delta a_{\parallel} = (-0.9 \pm 1.5) \times 10^{-14} \text{ GeV}$
 $\Delta a_X = (1.0 \pm 2.2) \times 10^{-14} \text{ GeV}$
 $\Delta a_Y = (-3.8 \pm 2.2) \times 10^{-14} \text{ GeV}$
 $Re(\xi) = -0.022 \pm 0.033$
 $Im(\xi) = 0.004 \pm 0.011$

These branching fractions all scale with $B(\overline{b} \to B_s^0)$.

The branching fraction B($B_s^0 \to D_s^- \ell^+ \nu_\ell$ anything) is not a pure measurement since the measured product branching fraction B($\overline{b} \to B_s^0$) \times B($B_s^0 \to D_s^- \ell^+ \nu_\ell$ anything) was used to determine B($\overline{b} \to B_s^0$), as described in the note on " $B^0 - \overline{B}^0$ Mixing"

For inclusive branching fractions, e.g., $B\to D^\pm$ anything, the values usually are multiplicities, not branching fractions. They can be greater than one.

$$\psi$$
(3770)

$$I^{G}(J^{PC}) = 0^{-}(1^{-})$$

Mass
$$m=3773.13\pm0.35$$
 MeV (S = 1.1) Full width $\Gamma=27.2\pm1.0$ MeV $\Gamma_{ee}=0.262\pm0.018$ keV (S = 1.4)

In addition to the dominant decay mode to $D\overline{D}$, $\psi(3770)$ was found to decay into the final states containing the J/ψ (BAI 05, ADAM 06). ADAMS 06 and HUANG 06A searched for various decay modes with light hadrons and found a statistically significant signal for the decay to $\phi\eta$ only (ADAMS 06).

Due to the complexity of the $c\overline{c}$ threshold region, in this listing, "seen" ("not seen") means that a cross section for the mode in question has been measured at effective \sqrt{s} near this particle's central mass value, more (less) than 2σ above zero, without regard to any peaking behavior in \sqrt{s} or absence thereof. See mode listing(s) for details and references.

Due to the complexity of the $c\overline{c}$ threshold region, in this listing, "seen" ("not seen") means that a cross section for the mode in question has been measured at effective \sqrt{s} near this particle's central mass value, more (less) than 2σ above zero, without regard to any peaking behavior in \sqrt{s} or absence thereof. See mode listing(s) for details and references.

NOTES

- [a] See the "Note on $\pi^\pm \to \ell^\pm \nu \gamma$ and $K^\pm \to \ell^\pm \nu \gamma$ Form Factors" in the π^\pm Particle Listings for definitions and details.
- [b] Measurements of $\Gamma(e^+\nu_e)/\Gamma(\mu^+\nu_\mu)$ always include decays with γ 's, and measurements of $\Gamma(e^+\nu_e\gamma)$ and $\Gamma(\mu^+\nu_\mu\gamma)$ never include lowenergy γ 's. Therefore, since no clean separation is possible, we consider the modes with γ 's to be subreactions of the modes without them, and let $[\Gamma(e^+\nu_e) + \Gamma(\mu^+\nu_\mu)]/\Gamma_{\text{total}} = 100\%$.
- [c] See the π^\pm Particle Listings for the energy limits used in this measurement; low-energy γ 's are not included.
- [d] Derived from an analysis of neutrino-oscillation experiments.
- [e] Astrophysical and cosmological arguments give limits of order 10^{-13} ; see the π^0 Particle Listings.
- [f] C parity forbids this to occur as a single-photon process.
- [g] See the "Note on scalar mesons" in the $f_0(500)$ Particle Listings . The interpretation of this entry as a particle is controversial.
- [h] See the "Note on $\rho(770)$ " in the $\rho(770)$ Particle Listings .
- [i] The $\omega \rho$ interference is then due to $\omega \rho$ mixing only, and is expected to be small. If $e\mu$ universality holds, $\Gamma(\rho^0 \to \mu^+ \mu^-) = \Gamma(\rho^0 \to e^+ e^-) \times 0.99785$.
- [j] See the "Note on scalar mesons" in the $f_0(500)$ Particle Listings .
- [k] See the "Note on $a_1(1260)$ " in the $a_1(1260)$ Particle Listings in PDG 06, Journal of Physics **G33** 1 (2006).

- [/] This is only an educated guess; the error given is larger than the error on the average of the published values. See the Particle Listings for details.
- [n] See the "Note on non- $q\overline{q}$ mesons" in the Particle Listings in PDG 06, Journal of Physics **G33** 1 (2006).
- [o] See the "Note on the $\eta(1405)$ " in the $\eta(1405)$ Particle Listings.
- [p] See the "Note on the $f_1(1420)$ " in the $\eta(1405)$ Particle Listings.
- [q] See also the $\omega(1650)$ Particle Listings.
- [r] See the "Note on the $\rho(1450)$ and the $\rho(1700)$ " in the $\rho(1700)$ Particle Listings.
- [s] See also the $\omega(1420)$ Particle Listings.
- [t] See the "Note on $f_0(1710)$ " in the $f_0(1710)$ Particle Listings in 2004 edition of *Review of Particle Physics*.
- [u] See the note in the K^{\pm} Particle Listings.
- [v] Neglecting photon channels. See, e.g., A. Pais and S.B. Treiman, Phys. Rev. **D12**, 2744 (1975).
- [x] The definition of the slope parameters of the $K \to 3\pi$ Dalitz plot is as follows (see also "Note on Dalitz Plot Parameters for $K \to 3\pi$ Decays" in the K^{\pm} Particle Listings):

$$|M|^2 = 1 + g(s_3 - s_0)/m_{\pi^+}^2 + \cdots$$

- [y] For more details and definitions of parameters see the Particle Listings.
- [z] See the K^{\pm} Particle Listings for the energy limits used in this measurement.
- [aa] Most of this radiative mode, the low-momentum γ part, is also included in the parent mode listed without γ 's.
- [bb] Structure-dependent part.
- [cc] Direct-emission branching fraction.
- [dd] Violates angular-momentum conservation.
- [ee] Derived from measured values of ϕ_{+-} , ϕ_{00} , $|\eta|$, $|m_{K_L^0} m_{K_S^0}|$, and $\tau_{K_S^0}$, as described in the introduction to "Tests of Conservation Laws."
- [ff] The *CP*-violation parameters are defined as follows (see also "Note on *CP* Violation in $K_S \to 3\pi$ " and "Note on *CP* Violation in K_L^0 Decay" in the Particle Listings):

$$\eta_{+-} = |\eta_{+-}| e^{i\phi_{+-}} = \frac{A(K_L^0 \to \pi^+ \pi^-)}{A(K_S^0 \to \pi^+ \pi^-)} = \epsilon + \epsilon'$$

$$\eta_{00} = \left| \eta_{00}
ight| \mathrm{e}^{i\phi_{00}} = rac{A(\mathcal{K}_L^0
ightarrow \pi^0 \pi^0)}{A(\mathcal{K}_S^0
ightarrow \pi^0 \pi^0)} = \epsilon - 2\epsilon'$$

$$\delta = \frac{\Gamma(K_L^0 \to \pi^- \ell^+ \nu) - \Gamma(K_L^0 \to \pi^+ \ell^- \nu)}{\Gamma(K_L^0 \to \pi^- \ell^+ \nu) + \Gamma(K_L^0 \to \pi^+ \ell^- \nu)} ,$$

$$Im(\eta_{+-0})^2 = \frac{\Gamma(K_S^0 \to \pi^+ \pi^- \pi^0)^{CP \text{ viol.}}}{\Gamma(K_L^0 \to \pi^+ \pi^- \pi^0)} ,$$

$$Im(\eta_{000})^2 = \frac{\Gamma(K_S^0 \to \pi^0 \pi^0 \pi^0)}{\Gamma(K_L^0 \to \pi^0 \pi^0 \pi^0)} .$$

where for the last two relations *CPT* is assumed valid, *i.e.*, $\text{Re}(\eta_{+-0}) \simeq 0$ and $\text{Re}(\eta_{000}) \simeq 0$.

- [gg] See the K_S^0 Particle Listings for the energy limits used in this measurement.
- [hh] The value is for the sum of the charge states or particle/antiparticle states indicated.
- [ii] $Re(\epsilon'/\epsilon) = \epsilon'/\epsilon$ to a very good approximation provided the phases satisfy *CPT* invariance.
- [jj] This mode includes gammas from inner bremsstrahlung but not the direct emission mode $K_I^0 \to \pi^+\pi^-\gamma(DE)$.
- [kk] See the K_L^0 Particle Listings for the energy limits used in this measurement.
 - [//] Allowed by higher-order electroweak interactions.
- [nn] Violates *CP* in leading order. Test of direct *CP* violation since the indirect *CP*-violating and *CP*-conserving contributions are expected to be suppressed.
- [oo] See the "Note on $f_0(1370)$ " in the $f_0(1370)$ Particle Listings and in the 1994 edition.
- [pp] See the note in the L(1770) Particle Listings in Reviews of Modern Physics **56** S1 (1984), p. S200. See also the "Note on $K_2(1770)$ and the $K_2(1820)$ " in the $K_2(1770)$ Particle Listings .
- [qq] See the "Note on $K_2(1770)$ and the $K_2(1820)$ " in the $K_2(1770)$ Particle Listings .
- [rr] This result applies to $Z^0 \to c\overline{c}$ decays only. Here ℓ^+ is an average (not a sum) of e^+ and μ^+ decays.
- [ss] See the Particle Listings for the (complicated) definition of this quantity.
- [tt] The branching fraction for this mode may differ from the sum of the submodes that contribute to it, due to interference effects. See the relevant papers in the Particle Listings.
- [uu] These subfractions of the $K^-2\pi^+$ mode are uncertain: see the Particle Listings.

- [vv] Submodes of the $D^+ \to K^- 2\pi^+ \pi^0$ and $K^0_S 2\pi^+ \pi^-$ modes were studied by ANJOS 92C and COFFMAN 92B, but with at most 142 events for the first mode and 229 for the second not enough for precise results. With nothing new for 18 years, we refer to our 2008 edition, Physics Letters **B667** 1 (2008), for those results.
- [xx] The unseen decay modes of the resonances are included.
- [yy] This is *not* a test for the $\Delta C=1$ weak neutral current, but leads to the $\pi^+\ell^+\ell^-$ final state.
- [zz] This mode is not a useful test for a ΔC =1 weak neutral current because both quarks must change flavor in this decay.
- [aaa] In the 2010 Review, the values for these quantities were given using a measure of the asymmetry that was inconsistent with the usual definition
- [bbb] This value is obtained by subtracting the branching fractions for 2-, 4- and 6-prongs from unity.
- [ccc] This is the sum of our $K^-2\pi^+\pi^-$, $K^-2\pi^+\pi^-\pi^0$, $\overline{K}^02\pi^+2\pi^-$, $K^+2K^-\pi^+$, $2\pi^+2\pi^-$, $2\pi^+2\pi^-\pi^0$, $K^+K^-\pi^+\pi^-$, and $K^+K^-\pi^+\pi^-\pi^0$, branching fractions.
- [ddd] This is the sum of our $K^-3\pi^+2\pi^-$ and $3\pi^+3\pi^-$ branching fractions.
- [eee] The branching fractions for the $K^-e^+\nu_e$, $K^*(892)^-e^+\nu_e$, $\pi^-e^+\nu_e$, and $\rho^-e^+\nu_e$ modes add up to 6.19 \pm 0.17 %.
- [fff] This is a doubly Cabibbo-suppressed mode.
- [ggg] The two experiments measuring this fraction are in serious disagreement. See the Particle Listings.
- [hhh] Submodes of the $D^0 \to K_S^0 \pi^+ \pi^- \pi^0$ mode with a K^* and/or ρ were studied by COFFMAN 92B, but with only 140 events. With nothing new for 18 years, we refer to our 2008 edition, Physics Letters **B667** 1 (2008), for those results.
 - [iii] This branching fraction includes all the decay modes of the resonance in the final state.
 - [iii] This limit is for either D^0 or \overline{D}^0 to pe^- .
- [kkk] This limit is for either D^0 or \overline{D}^0 to $\overline{p}e^+$.
 - [///] This is the purely e^+ semileptonic branching fraction: the e^+ fraction from τ^+ decays has been subtracted off. The sum of our (non- τ) e^+ exclusive fractions an $e^+\nu_e$ with an η , η' , ϕ , K^0 , K^{*0} , or $f_0(980)$ is 7.0 \pm 0.4 %
- [nnn] This fraction includes η from η' decays.
- [ooo] Two times (to include μ decays) the $\eta'\,e^+\,\nu_e$ branching fraction, plus the $\eta'\,\pi^+$, $\eta'\,\rho^+$, and $\eta'\,K^+$ fractions, is (18.6 \pm 2.3)%, which considerably exceeds the inclusive η' fraction of (11.7 \pm 1.8)%. Our best guess is that the $\eta'\,\rho^+$ fraction, (12.5 \pm 2.2)%, is too large.

- [ppp] This branching fraction includes all the decay modes of the final-state resonance.
- [qqq] A test for $u\overline{u}$ or $d\overline{d}$ content in the D_s^+ . Neither Cabibbo-favored nor Cabibbo-suppressed decays can contribute, and $\omega-\phi$ mixing is an unlikely explanation for any fraction above about 2×10^{-4} .
- [rrr] We decouple the $D_s^+ \to \phi \pi^+$ branching fraction obtained from mass projections (and used to get some of the other branching fractions) from the $D_s^+ \to \phi \pi^+$, $\phi \to K^+ K^-$ branching fraction obtained from the Dalitz-plot analysis of $D_s^+ \to K^+ K^- \pi^+$. That is, the ratio of these two branching fractions is not exactly the $\phi \to K^+ K^-$ branching fraction 0.491.
- [sss] This is the average of a model-independent and a K-matrix parametrization of the $\pi^+\pi^-$ S-wave and is a sum over several f_0 mesons.
- [ttt] An ℓ indicates an e or a μ mode, not a sum over these modes.
- [uuu] An $CP(\pm 1)$ indicates the CP=+1 and CP=-1 eigenstates of the D^0 $\overline{D}{}^0$ system.
- [vvv] D denotes D^0 or \overline{D}^0 .
- [xxx] D^{*0}_{CP+} decays into $D^0\pi^0$ with the D^0 reconstructed in CP-even eigenstates K^+K^- and $\pi^+\pi^-$.
- [yyy] \overline{D}^{**} represents an excited state with mass 2.2 < M < 2.8 GeV/c².
- [zzz] $X(3872)^+$ is a hypothetical charged partner of the X(3872).
- [aaaa] $\Theta(1710)^{++}$ is a possible narrow pentaquark state and G(2220) is a possible glueball resonance.
- [bbaa] $(\overline{\Lambda}_c^- p)_s$ denotes a low-mass enhancement near 3.35 GeV/c².
- [ccaa] Stands for the possible candidates of $K^*(1410)$, $K_0^*(1430)$ and $K_2^*(1430)$.
- $[ddaa] B^0$ and B^0_s contributions not separated. Limit is on weighted average of the two decay rates.
- [eeaa] This decay refers to the coherent sum of resonant and nonresonant J^P = 0^+ $K\pi$ components with $1.60 < m_{K\pi} < 2.15$ GeV/c².
- [ffaa] X(214) is a hypothetical particle of mass 214 MeV/c² reported by the HyperCP experiment, Physical Review Letters **94** 021801 (2005)
- $[ggaa] \Theta(1540)^+$ denotes a possible narrow pentaquark state.
- [hhaa] Here S and P are the hypothetical scalar and pseudoscalar particles with masses of 2.5 ${\rm GeV/c^2}$ and 214.3 ${\rm MeV/c^2}$, respectively.
 - [iiaa] These values are model dependent.
- [jjaa] Here "anything" means at least one particle observed.
- [kkaa] This is a B($B^0 \rightarrow D^{*-} \ell^+ \nu_{\ell}$) value.

- [*IIaa*] D^{**} stands for the sum of the $D(1\,^1\!P_1)$, $D(1\,^3\!P_0)$, $D(1\,^3\!P_1)$, $D(1\,^3\!P_2)$, $D(2\,^1\!S_0)$, and $D(2\,^1\!S_1)$ resonances.
- [nnaa] $D^{(*)}\overline{D}^{(*)}$ stands for the sum of $D^*\overline{D}^*$, $D^*\overline{D}$, $D\overline{D}^*$, and $D\overline{D}$.
- [ooaa] X(3915) denotes a near-threshold enhancement in the $\omega J/\psi$ mass spectrum.
- [ppaa] Inclusive branching fractions have a multiplicity definition and can be greater than 100%.
- [qqaa] D_j represents an unresolved mixture of pseudoscalar and tensor D^{**} (P-wave) states.
- [rraa] Not a pure measurement. See note at head of B_s^0 Decay Modes.
- [ssaa] For $E_{\gamma} > 100$ MeV.
- [ttaa] Includes $p\overline{p}\pi^+\pi^-\gamma$ and excludes $p\overline{p}\eta$, $p\overline{p}\omega$, $p\overline{p}\eta'$.
- [uuaa] For a narrow state A with mass less than 960 MeV.
- [vvaa] For a narrow scalar or pseudoscalar A^0 with mass 0.21–3.0 GeV.
- [xxaa] For a narrow resonance in the range 2.2 < M(X) < 2.8 GeV.
- [yyaa] J^{PC} known by production in e^+e^- via single photon annihilation. I^G is not known; interpretation of this state as a single resonance is unclear because of the expectation of substantial threshold effects in this energy region.

[zzaa]
$$2m_{\tau} < M(\tau^{+}\tau^{-}) < 9.2 \text{ GeV}$$

[aabb] 2 GeV
$$< m_{K^+K^-} < 3$$
 GeV

[bbbb]
$$X = \text{scalar with } m < 8.0 \text{ GeV}$$

[ccbb]
$$X\overline{X}$$
 = vectors with $m < 3.1$ GeV

[ddbb] X and
$$\overline{X} = \text{zero spin with } m < 4.5 \text{ GeV}$$

[eebb] 1.5 GeV
$$< m_X < 5.0$$
 GeV

[ffbb] 201 MeV
$$<$$
 M $(\mu^+\mu^-)$ $<$ 3565 MeV

- [ggbb] 0.5 GeV $< m_X <$ 9.0 GeV, where m_X is the invariant mass of the hadronic final state.
- [hhbb] Spectroscopic labeling for these states is theoretical, pending experimental information.

[
$$iibb$$
] 1.5 GeV $< m_X <$ 5.0 GeV

$$[jjbb]$$
 1.5 GeV $< m_X <$ 5.0 GeV

[kkbb] For $m_{\tau^+\tau^-}$ in the ranges 4.03–9.52 and 9.61–10.10 GeV.
